                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1, p. The decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR iste by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The CDNA vector was adjusted to have about 60NC. The CDNA vector was circularized with E. coli DNA ligase after digestion of EcoRi which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The cDNA bitained cDNA libraries constructed by this method are full-length enriched cDNA library. After analyzing and sequencing about 2,000 ~ 3,000 colonies in original cDNA library, the abundant cDNAs were selected and amplified by PCR reaction using vector region primer including T7 promotor as 5 primer and N(dT)14 as 3 primer. The PCR products were used as template for synthesis of biotinylated single stranded cDNAs probes were hybridized with antisense single stranded cDNAs probes were hybridized with antisense single stranded cDNAs propared from original liberary and incubated with avidin-gel. After removing DNA-RNA hybrids by centrifuse, the subtracted cDNA libraries were constructed by transformation of the remaining DNA into competent cells E. coli ToploF' with

/note= Torgan: Stomach; Vector: pT218RP1; Site_1: ECORI;
Site_2: Not1; The poly (A) + RNA was dephosphorylated with
bacterial alkaline phosphatase (BAP) and then decapped
with tabacco acid pyrophosphatase (TAP). The decapped
with tabacch acid pyrophosphatase (TAP). The decapped
intact mRNA was ligated with DNA-RNA linker including EcoR
i site by treatment of T4 RNA linkase and the first strand
cDNA was synthesized from oligo dT-selected mRNA by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The CDNA vector was circularized with E. coli DNA ligase after digestion of EcORI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Toploř by electroporation method. The CDNA libraries constructed by this method are full-length enriched cDNA library. Atter analyzing and sequencing about 2,000 ~ 3,000 colonies in original cDNA library, the abundant cDNAs were selected and amplified by PCR reaction using vector region primer including T7 promotor as 5' primer and N(dT)14 as 3' primer. The PCR products were used as template for synthesis of blottinylated single stranded RNA by in vitro transcription reaction. The synthesized RNA probes were hybridized with antisense single stranded cDNAs prepared from original liberary and incubated with avidin-gel. After removing DNA-RNA hybrids by centrifuge, the subtracted cDNA liberaries were constructed by transformation of the remaining DNA into competent cells E. coli Toplof' with

/clone lib="Ascites lib poly (A)+ RNA was dephosphorylated with boatcerial alkaline phosphatase (TAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I slite by treatment of T4 RNA ligase and the first strand conA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The CDNA vector was adjusted to have about 6 Ont. The CDNA vector was adjusted to a DNA strand by Okayama-Berg method. The converted to a DNA strand by Okayama-Berg method. The converted to a DNA strand by Okayama-Berg method are full-length enriched cDNA library. After analyzing and sequencing about 2,000 ~ 3,000 colonies in original cDNA library, the abundant cDNAs where selected and amplified by PCR reaction using vector region primer including T7 promotor as 5' primer and N(dT)14 as 3' primer. The PCR

products were used as template for synthesis of biotinylated single stranded RNA by in vitro transcription reaction. The synthesized RNA probes were hybridized with antisense single stranded cDNAs prepared from original liberary and incubated with avidin-gel. After removing DNA-RNA hybrids by centrifuge, the subtracted cDNA libraries were constructed by transformation of the remaining DNA into competent cells B. coli ToplOF' with electroporation method."

/done liber=$358NU16"
//done liber=$1. Not: The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped inteat mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand CDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOF' by electroporation method. The CDNA libraries constructed by this method are full-length enriched cDNA library."

/ Colo=="Vector: pry713D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from pooled colon tumor tissue, and was then primed with a Not I - oligo(dT) primer. Double-stranded CDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and Cloned into the Not I and Eco RI sites of the modified pT713 vector. This library is not normalized. Library constructed by Bento Scares and M. Patima Bonaldo. "Inbrary constructed by Bento Scares and M. Patima Bonaldo."

         The present sequence represents a human Reg I-gamma protein, which comprises a C-type lectin. The sequence was identified in Incyte clone alloward Reg I-gamma protein is involved in regulation of cell growth and development. Since the overexpression of reg proteins is associated with tumourogenesis and neurodegeneration, inhibition of human Reg I-gamma expression can be used for treating or preventing neoplasia or metastasis and neurodegenerative changes associated with Alzheimer's disease and other disorders of the central nervous system, e.g. Down's syndrome. Reg I-gamma can also be used in therapeutics to induce products can also be used for detection for, e.g. expression of REG I-gamma, diagnosis and drug screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 MASRSWRLLLLLSCLAKTGVLGDIIMRPSCAPGWFYHKSNCYGYFRKLRNWSDAELECQS

                                                                           A human colon specific protein (AAW12691) is a potential diagnostic marker for colon cancer. It is believed that the presence of active transcription of the colon specific gene in non-colon cells of a host is indicative of colon specific gene in non-colon cells sequence of the colon specific protein was deduced from a cDNA clone (AAT51784) isolated from a human colon cancer cDNA library. Recombinant colon specific protein can be produced in transformed host (e.g. bacterial, insect) cells and used to develop prods. for the diagnosis and treatment of colon disorders, partic. colon cancer metastasis. Antibodies raised against the protein can be used to target cancer cells and as part of a colon cancer vaccine.

The nucleic acid sequence can be used to develop products for the diagnosis of a disorder of the colon, e.g. colon cancer or metassases. The products can also be used to screen for agonists or antagonists for the polypeptides. The antagonists may be used to treat colon cancer, since they interact with the function of colon specific polypeptides to inhibit functions which are necessary for the viability of colon cancer cells. The products can also be used for the production of antibodies and for the identification of receptors for the
                                                                                                                                                                                                                                                                                                   1 MASRSMRLLLLLSCLAKTGVLGDIIMRPSCAPGWFYHKSNCYGYFRKLRNWSDAELECOS
                                                                                                                                                                                                                                                                 1 MASRSMRLLLLLSCLAKTGVLGDIIMRPSCAPGWFYHKSNCYGYFRKLRNWSDAELECQS
This is the amino acid sequence of a novel human protein comprising a secretory signal isolated from stomach cancer cells. Its proteins can be used as nutritional sources or supplements. The proteins may also have cytokine functions, immune modulating functions, haematopoiesis regulating activity, activin/inhibin regulating activity, chemotactic/chemokinetic activity, haemostatic and thrombolysic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity.
                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a purified human protein, which is primarily expressed in tissue derived from the colon. The protein is 152 amino acids in length and exhibits cytoetatic activity. The present sequence represents the amino acid sequence of the colon specific protein. The protein can be used in the diagnosis and treatment of colon cancer, and it is thought that abnormally high levels of the gene expression in non-colon cells is an indication of colon cancer metastasis.

Unique processerior in present inventor occupance production. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate colon tumour associated protein (TCAP) expression, such as colonic cancer. For example, (I) and (II) may be used to treat disorders associated with decreased expression by certifying mutations or deletions in a patient's genome that affect the activity of TCAPs by expressing inactive proteins or to supplement the patients own production of them. Additionally, (II) may be used to proteints of TCAP proteins, by inserting the nucleic acids into a host cell culturing the cell to express the protein. (II) may be used to polymerase chain reaction (PCR) and hybridisation assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. (I) may also be used as antigens in the production of antibodies against TCAPs and in assays to identify modulators of TCAP expression and activity. Anti-(I) antibodies and antagonists may also be used to down regulate TCAP expression and activity. The anti-(I) antibodies may also be used be used

(I) have cytostatic activity. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate colon tumour associated protein (TCAP) expression, such as colonic cancer. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the
as diagnostic agents for detecting the presence of TCAPs in samples (e.g., by enzyme linked immunosorbant assay (ELISA)). AAI28460 to AAI295 and AAM2494 to AAM24523 represent nucleoride and amino acid sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MASRSMRLLILLSCLAKTGVLGDIIMRPSCAPGWFYHKSNCYGYFRKLRNWSDAELECQS

activity of TCAPB by expressing inactive proteins or to supplement the patients own production of them. Additionally, (II) may be used to produce the TCAP proteins, by inserting the nucleic acids into a host cell culturing the cell to express the protein. (II) and its complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic polymerase chain reaction (FCR) and hybridisation assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. (I) may also be used as antigens in the production of antibodies against TCAPs and in assays to identify modulators of TCAP expression and activity.

Anti-(I) antibodies and antagonists may also be used to down regulate TCAP expression and activity. The anti-(I) antibodies may also be used as diagnostic agents for detecting the presence of TCAPs in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). AAI2840 to AAI29512 and AAM2451 represent nucleotide and amino acid sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 YGNGAHLASILSLKEASTIAEYISGYQRSQPIWIGLHDPQKRQQWQWIDGAMYLYRSWSG 120

Colon tumor associated proteins and nucleic acids useful for the

```
The present invention describes colon tumour associated proteins (1) and the polynucleotides (11) that encode them. (1) have cytostatic activity. (1) and (11) can be used in gene therapy and vaccine production. (1) and (11) and be used in the prevention, diagnosis and treatment of diseases associated with inappropriate colon tumour associated protein (TCAP) corpusation, and activity of cross associated with decreased expression by cativity of TCAPs by expressing inactive proteins or supplement the cativity of TCAPs by expressing inactive proteins or supplement the particles own production of them. Additionally, (II) may be used to produce the TCAP proteins, by inserting the nucleic acids into a host complementary sequences may also be used as DNA probes in diagnostic polymerase chain reaction (PCR) and hybridisation assays to detect and the presence of similar nucleic acids in samples, and the presence of similar nucleic acids in samples, and the presence of similar nucleic acids in samples, and in assays to identify modulators of TCAP expression and activity. The anti-(I) antibodies and antagonists may also be used to down regulate to the presence of similar nucleic acids in samples, and in assays to identify modulators of TCAP expression and activity. The anti-(I) antibodies may also be used to a diagnostic agents for detecting the presence of TCAPs in samples.

Chai:-(I) antibodies and antagonists may also be used to down regulate to a diagnostic agents for detecting the presence of TCAPs in samples.

Chai:-(I) antibodies and antagonists may also be used to down regulate and antagonists and antagonists may also be used to down regulate and antagonists and antagon

The present invention describes colon tumour associated proteins (1) and the polynucleotides (11) that encode them. (1) have cytostatic activity. (1) and (11) can be used in gene therapy and vaccine production. (1) and (11) may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate colon tumour associated protein (TCAP) carpression, such as colonic cancer. For example, (1) and (11) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the cativity of TCAPs by expressing inactive proteins or to supplement the produce the TCAPs by expressing inactive proteins or to supplement the produce the TCAPs by expressing inactive proteins or to supplement the production of them. Additionally, (11) may be used to call culturing the cell to express the protein. (11) and its call culturing the cell to express the protein. (11) and its complementary sequences may also be used as DNA probes in diagnostic polymerase chain reaction (FCR) and hybridisation assays to detect and the presence of similar nucleic acids in samples, and the assays to identify medulators of TCAP expression and activity. Anti-(1) antibodies and antagonists may also be used as antigens in the production of antibodies may also be used as diagnostic agents for detecting the presence of TCAPs in samples. Anti-(1) antibodies and antagonists may also be used as diagnostic agents for detecting the presence of TCAPs in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). AAI29512 and AAMA4494 to AAMA4523 represent incleotide and aniho acid sequences and AAMA4494 to AAMA4523 represent incleotide and aniho acid sequences given in the exemplification of the present invention.

The method is useful for detecting the presence of a tumnur. Kits comprising an antibody specific for RELP and reagents for detecting the antibody, or a nucleic acid complementary to a portion of a nucleic acid encoding RELP, are useful for identifying the presence of cancer, characterise the cancer, or monitor the course of treatment of cancer. The present sequence is human RELP protein used to illustrate the method of the invention. Human RELP gene is located at
                                                                                                                                                                                                                                                                                                                                                                                  Detecting the presence of a tumor comprises detecting the concentration of a Reg Like Protein or the presence or quantity of a nucleic acid encoding it \, -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a human TSA7005 protein which shares 32% homology with human and mouse Reg proteins, and 34% homology with the rat Reg protein. TSA7005 has panceatic beta cell growth activity and hypoglycaemic activity. The TSA7005 protein can be used for the diagnosis and treatment of diseases associated with the gene and its

The present sequence represents a new isolated REG-like protein (RELP) human immunoglobulin (Ig) derived protein. RELP comprises: (a) a human variable and connetant region, or (b) an isolated human Ig derived protein or specified portion or variant encoded by a nucleic acid. RELP has cytostatic activity and can be used as an Ig agonist and in protein threrapy. The RELP human Ig derived protein or a specified portion or variant can be used for preventing or treating a RELP protein mediated condition, malignant condition or disease condition, e.g. cancer. The nucleic acids can be used in producing RELP Ig derived chromosome 1p12-13.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated REG-like protein (RELP) human immunoglobulin derived protein or specified portion or variant, useful for preventing or treating a RELP protein mediated condition or malignant condition, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78991 to ABB79004 represent proteins encoded by the ABQ60775 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide cuced by (I) is useful for detecting cancer in a patient sample, and cor detecting the presence or absence of a polynuclectide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a pyridises to (I), and for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the corresponding gene resides, and in tissue profilling, forensics, genetic analysie, mapping and diagnostic applications. (I) can be used to raise

XX PT New polymucleotide, useful for the preparation of a composition for stimulating an immune response against, or treating, cancer - TX Disclosure; Page 465; 537pp; English.
XX The present invention describes compounds (I) for the immunotherapy and CC diagnosis of colon cancer. Also described: (I) a method for stimulating and immune response in a patient; (3) an isolated T cell specific for a tumour protebi; (3) an isolated T cell comprising T cells prepared by the method of (2); (4) a method CC expanding T cells specific for a tumour protebi; (3) an isolated T cell comprising T cells prepared by the method of (2); (4) a method CC expanding an immune response in a patient; (6) a method for inhibiting the Corporation comprising an immune response in a patient; (6) a method for inhibiting the Corporation and Can be used in vaccines. AB232646 to AB23325 CC and ABP55331 tepresent human colon cancer/tumour related Sequence 158 AA;
Sequence 158 AA;

- AB We have determined the nucleotide sequence of reg1 a human genomic DNA fragment homologous to the reg gene which is expressed in the exocrine pancreas and regenerating islets. Sequence comparisons of reg and reg1 suggested similar exon-intron organisation. Based on this assumption, specific oligonucleotides for reg1 exons were used to demonstrate expression of the reg1 gene in pancreas and liver, The proteins encoded by reg and reg1 comprise 166 amino acids and differ by 22 amino acids only.

                                                                                                                                                                                                                                                                                                                                                                                                                                   "The glycan moiety of human pancreatic lithostathine. Structure characterization and possible pathophysiological implications.";

Eur. J. Balochem. 230:503-510(1995).

-!- FUNCTION: MIGHT ACT AS AN INHIBITOR OF SPONTANEOUS CALCIUM CARBONATE PRECIPITATION. MAY BE ASSOCIATED WITH NEURONAL SPROUTING IN BRAIN, AND WITH BRAIN AND PANCREAS REGENERATION.

-!- PTW: ALL O-LINKED GLYCANS CONSIST OF GAL-GLCNAC-GAL-GALNAC TETRASACCHARIDS CORE AND GET ELONGATED (MICROHETEROGENEITY).

-!- SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LITHOSTATHINE 1 BETA.
